

Project Two Report

Project Two was a relatively shorter project (compared to the rest) and took me around 6 hours of coding to complete. Since a lot of help was given on the lecture notes, I wasn't totally lost, and looking through the JUCE library helped me a lot as well. This was a fairly simple, and immensely useful project. I think the thing that was the most taxing was having to account for so many different parameters and having to code each one individually. The GUI doesn't look great on this one, but I am starting to get the hang of coding GUIs and am seeing a little improvement in the designs. My signal flow will be in another file in this folder. I also found out where to name my project when creating it so it wasn't NewProject.vst3 again. It's the small victories that count.
